DUALISM- THE WORLD OF THE PENUMBRA-Part 3

The Emergence of Unknown Viruses

Part 1

Introduction

In part 1 and part 2 of this article, we have explored the topic of dualism in the simplest terms. In this and the next part of the article, we will examine the topic of duality more deeply and scientifically and the root of the contradiction and discrepancy in the universe caused by mutual activities between electronic and positronic sources (light and darkness).

To get to the heart of the matter, and to remain within the bounds of academic scientific definitions, we want to present a very simple description of the two topics used in quantum mechanics, which can aid in understanding this article.

The first case:

One unit of energy used in atomic physics, particle physics and quantum mechanics is the **electronvolt**[1].

One electronvolt is the same:

$1eV = 1.602176634.10^{-19}$ J

The second case:

According to the laws of quantum mechanics derived from Einstein's **special theory of relativity**[2], the sum of energy and mass in a system is equal. This result, which is accepted by particle physics, **nuclear physics**[3] and **astrophysics**[4], is derived from the well-known formula of the theory of relativity as follows

$E=mc^2$ $c=1 \Rightarrow E=m$

It is questionable why the speed of light is set to one in this formula.

In the world of physics, it is generally accepted that the sum of energy and mass in the universe is fixed and unchangeable, and that only the conversion of matter into energy and one type of energy into another is possible.

It should be noted that **Planck's constant**[5] is an essential component of quantum mechanical calculations.

Considering the two cases mentioned above, we can now present and substantiate our theory.

The theory of energy sources at the University of the Perfection Process

Two original energy sources

According to Ostad Elahi's Creation Report, the energy question in the universe is based on an unchanging principle. This principle is:

"The total energy of the universe from the beginning to the present, and from that time to the final stage of the expansion of the universe, comes from two completely opposite sources that are always and everywhere present before each other."

The creation of the universe and the origin of any kind of phenomenon is the result of a conflict between these two types of energy sources. Each of these sources has its own characteristics and creates its own beings.

The most important of these beings are the **fermions**[6] from the electronic world and the antifermions from the positronic world.

Now, we can take a quick look at both sources.

Here, we assume that the readers of this article have previously read the two easy-to-understand articles on dualism (Part I and Part II).

The first source: The electronic world

In the *"Integrated Sciences"* section, the eighth article based on Master Elahi's Creation Report, we conclude that the first creation, which Master Elahi called *"Mahiaat"*, can be considered by a new definition as an "*Electropositron"* because this very knowledgeable and powerful creature has both energy sources at its disposal.

Based on other results that we have extracted from this report and made available to the public, we have called the world of light the electronic world, and have considered an electron as a **holographic**[7] reflection of the primary electron, which can produce eleven more particles at any given time.

These particles are called fermions in particle physics. A down quark for example is the material manifestation of the third creation after Mahiaat. To better understand the topic of holographic reflection and manifestation, we can compare it to the sun and its light on the surface of water.

It is important to note that the Mahiaat has inherited the original knowledge of creation from the original source of creation (God), upon which the entire universe was created. In this respect, the two worlds of light and darkness can be seen as two tools that serve this purpose.

The electronic world, however, is the world of light. This world has its own special quantomagnetics, which are the most primitive building blocks of electronic features and macro features. Kindness and compassion, for example, are two electronic attributes, while they also have the ability to create objective attributes. A tree, for example, allows birds to build nests on its branches. In an advanced situation, for example, a mother enjoys breastfeeding her baby, although it can sometimes be very painful.

These and all similar positive or negative mental and psychological characteristics are caused by **Quantomagnetics and Antiquantomagnetics**[8].

In general, one can say that Quantomagnetics (Quantomagnets) as well as Antiquantomagnetics (Antiqantomagnets) work on two levels: On the mental and psychological level and at the same time on the physical level and its action.

Further information on this topic can be found in the article "**Emergence of instinctive features and characteristics"**[9] in the section ***"Integrated Science"***.

Another example:

Loss rejection is an immaterial trait that causes a large number of platelets to attach themselves to the surrounding injured tissue or to each other at the body level in order to close the injury.

All attributes relating to the world of light are under the influence of the Gain Attraction and the Loss Repulsion Force, which ensure the survival of each system and lead it to a more stable state than before.

To fully understand this, you are also referred to the article that will soon be published in the Integrated Science section under the title **"How an Electropositron Thinks and Works to Create an Atom"**[10].

Completely colloquial and simple, all the qualities that are considered good come from the world of light. But this world also creates beings that are the result of the above-mentioned qualities. For example, it can be scientifically said that light or electronic features create a variety of microscopic or even unicellular organisms that protect the human body from parasites.

Professor Roth Lee, Director of Microbiology at the Max Planck Institute, says:
"The microbiome is important for human health. The human body is not just made up of human cells."

Professor Knight says:

„We recently discovered how these microscopic creatures have an incredible effect on our health."

Dr. Terfer Lally of the Wellcome Trust Sanger Institute says:

"Every day, more evidence shows that repairing a person's microbiome can lead to the treatment of diseases like ulcerative colitis, an inflammatory bowel disease."

([11] documents supporting all three quotations.)

The above statements show that although researchers do not know how creation came into being and how its mechanism works, they have learned from laboratory experience that there are many microscopic organisms in our bodies that actively play a role in our health.

Unfortunately, these scientists do not know the origin of this useful microbiome, and that is exactly what we want to reveal and explain.

It should be noted here that all light beings seek the highest level of perfection.

The second source: The Positronic World

In the same way and with the same argument as above, we have called the world of darkness the **Positronic World**. This world is actually a source of a particular kind of energy that has its own special properties. Each of these properties has a counterpoint in the electronic world that is in stark contrast to it.

This means that:

"Profit attraction is a peculiarity of positrons to damage the opposite property in the electronic world. Of course, the reverse is also true."

Positronic features are caused by Antiquantomagnetics and produce their own organisms after the formation of large networks (Macroantiquantomagnetics). For example, this includes all microscopic organisms and microbiomes that are harmful to the body, including a variety of parasites. These positronic beings also have their own strategy in terms of loss-repulsion and gain-attraction to ensure their survival. The survival of these beings means the destruction of electronic beings.

In addition to the natural death caused by the expiration of the time allotted for this type of creation, the biological death caused by disease is often due to the complete survival of the positronic organisms. Accidents are not included in this process.

Colloquially speaking, all the characteristics that are considered negative and harmful for us humans come from the positronic world.

Balance in two electronic and positronic energy sources

According to the teachings of the University of the Perfection Process:

"In the universe, the amount of electronic energy must always equal the amount of positronic energy."

To understand the logic of this, it is necessary to know that, from the point of view of the eternal origin of creation, these two worlds have no superiority over each other, and both must have their own special possibilities. For, if there is an imbalance between these two sources of energy, one will dominate the other and the result would be that the main goal of creation, namely the perfection of beings created from both sources, would be disturbed. Because:

"The perfection process means recognising the right way and the eternal commandments through the contradictions that arise from these two sources and putting them into practice."

For example, suppose that the electronic beings and forces on a hypothetical planet X were absolutely superior. In that case, there would be no positronic force capable of producing traction and gravity in the opposite direction. The people on this planet would be compulsorily attracted by the magnetic force of the only source of energy, namely light, without having to make any effort in this direction, as they would have no counterforce in front of them. Thus, these people would not be able to make spiritual progress and thus strengthen their soul. They would also not be able to complete their perfection and return home.

Assuming that this happens in the opposite direction, in the absence of an inhibiting Electronic Force, all people from these hypothetical planets would then automatically and very simply be attracted to the positronic source and negative energy. Therefore:

"The basis of the perfection process for all creatures is to be in the range between two electronic and positronic sources."

I think that the above examples are sufficient to clarify the concept of the value of both energy sources. To this end, one can list thousands of examples in all categories of creation, but in the future, this will be the responsibility of the younger generation of students of the University of the Perfection Process of Ostad Elahi.

Before we turn to other states of the subject under discussion, it should be noted that there is no dark perfection in the whole of existence, because perfection has only one side, and that is the return to the origin of creation (God), which is free of light and darkness and has a special quality.

In this respect, it should be noted that a dark being can achieve perfection through seriousness, effort and endeavour, whereas a light being through wasting time and carelessness can forever lose the possibility to achieve perfection.

Relative balance between the two sources

So far, we have found that the amount of electronic and positronic energy must be the same throughout the universe. However, this does not mean that the value of these two energies is the same throughout the universe. For example, the Earth and some other planets are located at relatively deep points in space, where, in general, the balance between the two energy sources is disrupted in favour of positronic energy. Therefore, the volume of positronic actions and thoughts is much greater than the volume of electronic actions, thoughts and intentions. This fact makes it significantly more difficult to perceive or recognize truth on such a planet, and therefore it is not easy to absorb light from an electronic energy source.

To be able to study the problem of the balance of forces in the human body, we must first know what is meant by the balance of energy from both sources. For this purpose, we use the famous Chinese graphic of Yin Yang.

Pay attention to the first graphic.

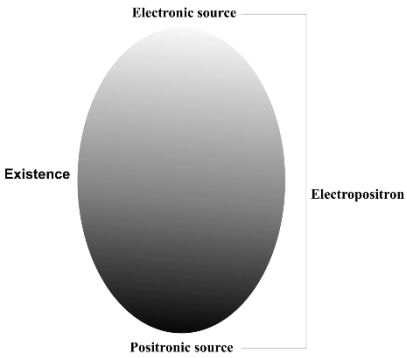
We accept this Yin Yang graph as it is, and while explaining our theory, we complete this graph.

This image most effectively illustrates the constant conflict between the two worlds, the electronic (white fish) and the positronic (black fish). Another thing that can be extracted from this graph is that the quantity and volume of the two sources are the same. The black circle in the white fish, from our point of view, represents the existence of light effects in the dark world (positron) and vice versa. The white circle in the dark world means that there are effects of the electronic world on the positronic world.

This graph is only partially able to show the interaction of the two energy sources. But absolute light and darkness can only be found in the origin of each source. This means that both light and darkness can penetrate the entire universe.

In other words, you could say:

"The energy that dominates the universe is roughly in the range between light gray and dark gray."



To illustrate this thesis, I have designed another graph that comes closer to reality. Please pay careful attention to this graphic:

This graph shows that all levels of the universe are affected by both light and dark sources. This is consistent with the reality of the universe, except that the energy expansion of both sources is not evenly distributed as shown in this graph.

Paragraph:

"In the entirety of existence, the dominance of electronic energy in one region is balanced by the dominance of positronic energy in another."

End of part 3 of the article
End of the first part of the topic
